# Lasers For Surgery

by Ranjan Thilagarajah  
Consultant Urological Surgeon, Broomfield Hospital

The first laser was produced in the early 1960's. Advances in lasers and fiberoptics in recent years make them ideally suited to travel through routes in the human body where no hand or scalpel has gone before. Urology is the diagnosis and treatment of diseases or disorders of the prostate, bladder, ureter and urethra. With an increase in use of small-diameter endoscopic instruments, urology has been drastically and positively influenced by this technology. This lecture will outline some of the developments and procedures used today.

**Telford Lecture Theatre, BAE SYSTEMS, Gt. Baddow CM2 8HN  
Wednesday 28 March 2007, 6:00 for 6:30pm**

**An IET Essex Network Event
